

GLOBAL EV MARKET ANALYTICS

A Real, Web-Scraped Data Analysis of the Production Electric Vehicle Market

Data Analytics Phase | requests + BeautifulSoup → Pandas → Streamlit
Source: Wikipedia — List of Battery Electric Vehicles (243 real production models)
Prepared by S Mohammed Kaif

Executive Summary

Real production-EV data, scraped and analyzed end to end

243

Real EV Models
Analyzed

59

Manufacturers
Tracked

17

Origin
Countries

2010–26

Launch Years
Covered

Top-line findings:

- EV launches accelerated sharply post-2020 — 132 of 243 tracked models launched 2023 onward.
- Crossover SUV dominates body styles (140/243 models, 58%), and its share is still rising.
- Dedicated BEV-platform adoption jumped from 58% (2020) to 84% (2025) — automakers are moving off converted ICE platforms.
- Chinese-market EVs now account for over a third (88/243) of tracked production models.

Methodology

From raw HTML to production-ready insight — a fully reproducible pipeline

01

Scrape

requests + BeautifulSoup pull structured wikitables directly from Wikipedia's production EV listings.

02

Load & Combine

Global-market and Chinese-market tables merged into one dataset with a Market flag.

03

Clean & Inspect

Deduplication, text standardization, missing-value audit, multi-value body-style splitting.

04

Feature Engineer

Model age, launch era, region grouping, manufacturer parent-group roll-up, SUV flag.

05

Statistical Testing

Chi-square, linear regression, and two-proportion z-tests validate every visual pattern.

06

Dashboard + Deck

Interactive Streamlit app for live exploration; this deck for executive presentation.

Finding 1 — EV Launches Are Accelerating

Statistically significant upward trend confirmed via linear regression ($p < 0.05$)

53

models launched in 2023 alone — the single biggest year on record

132 of 243 tracked models (54%) launched in just the last 4 years (2023-2026).

Finding 2 — China Is Now a Core Battleground

Body-style preference differs significantly by market (chi-square, $p < 0.05$)

Finding 3 — The Manufacturer Landscape Is Consolidating

Parent-group roll-up reveals concentration behind dozens of individual brand names

Finding 4 — Automakers Are Betting on Purpose-Built EVs

Dedicated BEV platform adoption and SUV share are both rising together

Dedicated BEV Platform Share

58% → 84%

2020

2025

Purpose-built EV architecture is fast becoming the industry default rather than the exception — converted ICE platforms are on the way out.

SUV/Crossover Body-Style Share

44% → 67%

2010-19

2023-26

Two-proportion z-test confirms this shift is statistically significant, not random noise — SUVs are the new EV default body style.

Business Recommendations

What these patterns mean for product, market entry, and platform strategy

1 Prioritize dedicated BEV platforms

84% of 2025 launches use purpose-built architecture — converted-ICE EVs risk looking dated to buyers and dealers alike.

2 Lead with Crossover SUV body styles

58% of all tracked models (and rising) are Crossover SUVs — this is the safest default body style for a new EV entry.

3 Treat China as a distinct product market

Body-style mix differs significantly between Global and Chinese markets — a one-size-fits-all model lineup will underperform.

4 Expect continued launch-volume growth

The 2010-2025 launch trend is statistically significant and upward — competitive intensity will keep increasing, not plateau.

What's Next in This Project

This is Phase 1 of a 3-phase build across Data Analytics, Data Science, and Machine Learning

Phase 1 ✓

Data Analytics

Scraping, cleaning, feature engineering, statistical testing, and this dashboard + deck.

Phase 2

Data Science

Predictive modeling, clustering, and deeper explainability on the EV market dataset.

Phase 3

Machine Learning

Production model packaged behind a live Streamlit prediction web app.
